Its products can be used to identify substances which have a stimulatory or inhibitory effect on the enzyme activity. Such substances can be used to modulate dendritic cell (DC) function and for immunomodulation. They can be used in the treatment of e.g. autoimmune diseases, transplantations or cancers. The products can also be used for detection and diagnosis.

The invention relates to an isolated nucleic acid molecule (I) come a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for:
(a) assessing whether a patient is afflicted with prostate cancer (b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer -
                                                                                                                                                   selecting a composition for inhibiting prostate cancer in a patien assessing the prostate cell carcinogenic potential of a compound; determining whether prostate cancer has metastasized in a patient; assessing the aggressiveness or indolence of prostate cancer in a
                                                                             also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                  the efficacy of a therapy for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Š
                         CC This sequence encodes a human S-adenosyl-5-homocysteine hydrolase (SAHH).

CC The SAHH protein can be used to generate specific antibodies and in drug screening to identify specific binding agents. Antagonists of the comprohening to identify specific binding agents. Antagonists of the protein are used to treat or prevent a wide range of viral, bacterial, compared to treat or prevent a wide range of viral, bacterial, compared to treat or prevent a wide range of viral, bacterial, compared to treat or prevent a wide range of viral, bacterial, compared to the sequence of the sequences, and many autoimmune diseases (e.g. acquired immune deficiency syndrome, allergy, asthma, diabetes compilities, multiple sclerosis etc.). All these conditions may be treated by expressing antisense sequences, triplex-forming agents or ribozymes can be used against the nucleic acid. The nucleic acid and its fragments can be used as probes or primers for detecting and quantifying gene expression, for diagnosis or monitoring of disease, to identify genetic variations, mutations or polymorphisms, in gene mapping and as antisense therapeutics. Antibodies are used directly as antagonists, indirectly to disease in standard immunoassays, in competitive drug screens and to constant the protein from natural sources.
                                                                                                                                                                                                                                                                                                                               Disclosure;

The invention relates to isolated polynucleotide (I) and CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC for identifying expressed genes. (I) is useful in gene therapy techniques CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in CC diagnostics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences: AAS64197-AAS94564 represent novel human CC diagnostic coding sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed content of the pulpo, int reminished and references.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2074
                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; chromosome mapping; gene mapping; gene therapy; forensic;

(leukaemia, lymphoma or solid tumours), and many autoimmune diseases (e.g. acquired immune deficiency syndrome, allergy, asthma, disabetes melitus, multiple sclerosis etc). All these conditions may be treated by expressing antisense sequences, triplex-forming agents or ribozymes directed against the nucleic acid. The nucleic acid and its fragments can be used as probes or primers for detecting and quantifying gene expression, for diagnosis or monitoring of disease, to identify genetic variations, mutations or polymorphisms, in gene mapping and as antisense therapeutics. Antibodies are used directly as antagonists, indirectly to deliver active agents to SAHH-expressing cells, to diagnose and monitor diseases in standard immunoassays, in competitive drug screens and to isolate the protein from natural sources.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence encodes a human S-adenosyl-5-homocysteine hydrolase (SAH protein can be used to generate specific antibodies and in dr screening to identify specific binding agents. Antagonists of the protein are used to treat or prevent a wide range of viral, bacterial, fungal, parasitic, protozoal or helminthic infections, many cancers

proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; prostate cancer; prostate cancer antigen; detection; diagnosis; neuroprotective; cytostatic; cardioactive; immunomodulatory; muscular; vulnerary; gastrointestinal; nephrotropic; antiinfective; gynaecological; antibacterial; gene therapy; neural; immune; reproductive; renal; gastrointestinal; pulmonary; cardiovascular; prollferative disorder; wound; infactious disease; ss.

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1; SEQ ID NO 40834; 21pp + Sequence Listing; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid genes from Drosophila and interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Drosophila melanogaster

(III) encoding (II) having a sequence (S2), a T cell
cc population of (II), or antigen presenting cells that express (II).
cc (I) has cytostatic activity. An oligonuclectide (IV) that hybridises to
cc (S1) can be used for detecting ovarian cancer in a patient's biological
cc contacting a biological sample from a patient with (IV), detecting the
cc contacting a biological sample from a patient with (IV), detecting the
cc amount of polynuclectide hybridising to (IV) and comparing the amount to
cc a predetermined cutoff value and thereby detecting ovarian cancer in the
cc entient, where the amount of polynuclectide hybridising to (IV) is
cd detected preferably by polymerase chain reaction (PCR). (I) comprising
cc (III) and/or (II) is useful for stimulating and/or expanding T cells
cc with (III) or (III) is useful in design and preparation of
cc with (III) or (III) is useful in design and preparation of
cc with (III) or (III); and tumour cells; and to isolate a full length gene from a
cutable library e.g., a tumour CDNA library using well known

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   299
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1621
```

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1152
                                                                                                           specification or its complement. (I) is useful for:
(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient;
(d) assessing the efficacy of a therapy for inhibiting prostate cancer.
                                                                                                                                                                                      The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; prostate pharmacogenomic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ABV44141

The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2826 TOTOTOTTGCGATTGAACTCACTTAATGGTCACTTGATCTCTTTGTTAGCCTGTTTCACC

The CDNA clones can be used to generate antisense oligonuclectides which can be used for antisense therapy. Methods and products from the present invention can be used for identifying and/or classifying cancerous cells present in a human tumour, particularly in solid tumours, e.g. carcinomas and sarcomas, e.g. breast or colon cancers. The CDNA clones can be used for developing agents for the diagnosis and treatment of disorders involving unwanted cell proliferation, such as neoplasia dysplasia or hyperplasia.

The polynucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polynucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoletic cells, autoimmune disorders, allergic reactions, graft versus host disease and organ rejection, modulate haemostatic or thrombolytic activity, modulate inflammation, cancers, cardiovascular disorders, neurological disease and bacterial or viral infections. The peptides, nucleotides, antibodies, agonists and antagonists may be also be used in drug screens. AAC78449 to AAC78457 and AAB44240 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antidiabetic; antiasthmatic; antirheumatic; antiarthritic;

Contact: MGC help desk
Email: cgapbs-r@mail.nih.gov
Tissue Procurement: ATCC
cDNA Library Preparation: Rubin Laboratory
cDNA Library Arrayed by: The I.M.A.G.E. Consortium
DNA Sequencing by: Genome Sequence Centre,
BC Canada
Clone distribution: MGC clone distribution information can be for through the I.M.A.G.E. Consortium/LiML at: http://image.linl.gov/series: IRAL Plate: 22 Row: h Column: 21

This clone was selected for full length sequencing because it passed the following selection criteria: Hexamer frequency ORF analysis, Similarity but not identity to protein.
                                                                                                                                                                                                                         Steven Jones, Jennifer Asano, Ian Bosdet, Yaron Butterfield, Susanna Chan, Readman Chiu, Chris Fjell, Erin Garland, Ran Guin, Letticia Histao, Martin Krzywinski, Reta Kutsche, Oliver Lee, Soo Sen Lee, Victor Ling, Carrie Mathewson, Candice McLeavy, Steven Ness, Pawan Pandoh, Anna-Liisa Prabhu, Parvaneh Saeedi, Jacqueline Schein, Duane Smailus, Michael Smith, Lorraine Spence, Jeff Stott, Michael Thorne, Miranada Tsai, Natasja van den Bosch, Jill Vardy, George Yang, Scott Zuyderduyn, Marco Marra.
